Which TradingView chart aligns best with the FundedNext platform?

Updated over 2 weeks ago

We recognize that many of our clients prefer using **TradingView** for their market analysis. However, it's crucial to highlight that the charts of our technology provider, **FundedNext**, are not available on TradingView.

It's important to note that chart data on TradingView, particularly for instruments like indices such as **US30** or **GER30**, may not fully align with the data on our platform. This discrepancy arises because various **CFD brokerages have unique Liquidity Providers (LPs)**, leading to potential variations in pricing, candle structures, and other chart elements. These differences are influenced by factors such as current market liquidity, spreads, data feed sources, quotes from LPs, and server locations.

Indices are inherently more volatile than other markets, making them particularly susceptible to these variations. TradingView's aggregated data from multiple CFD brokerages may differ significantly from our platform's real-time data for indices.

To ensure accuracy in your trading decisions, we recommend using FundedNext charts for critical actions like setting Stop Loss/Take Profit levels or evaluating risks. While TradingView charts are useful for analysis, cross-referencing with FundedNext ensures alignment with our platform's live data, providing a more reliable trading experience.
